

# Future of Drones: Cool Uses & Impact

By **Kaya Olsen**

April 29, 2021 / Moonshot Pirates

Drones, which were first used mainly by the military (1), are now used in many different areas of life, like delivering packages, helping with farming (2), and keeping people safe. They are very useful because they can do a lot of different things and are easy to use.

These flying (3) robots can go to places that people can't, like caves, and help find and rescue (4) people. They also help protect animals that are in danger by watching over places where they live and scaring away (5) people who want to hurt them.

Drones are also changing how things are delivered. In South Korea, they are trying out taxi drones, and Amazon is using them to deliver (6) packages faster and cheaper. They can also make events more exciting with lights and cool camera angles (7). While drones might take some jobs away, they also create new ones and help people in different ways. They can do things that are boring or dangerous, which makes things cheaper and easier for everyone. Using electric (8) drones instead of other ways to deliver things is also better for the environment.

By making transportation more efficient (9), drones give people more time to do fun things and be creative. They also help us see the world in new ways by taking pictures and videos from high up. As long as (10) we have rules to follow, drones can help us enjoy life more and explore new places. They are changing a lot of things and will keep changing the way we live in the future.
